

APAC Data Analysis

Author: Derek

Create Date: 2025-06-29

Version: 0.1

Content: Initial version with data cleansing and transformation

Requirement

- 1. ignore data "plan month" after present month
- 2. keep 2023 data in the sheet but exclude from the visualization.
- 3. combine china south & china north team into China
- 4. convert order quantity(column S) and unit(column T) from kg/g into MT(1000KG=1MT), keep PC as is for japan(1pc= 1MT)
- 5. show average of volumn (by quarter)
- 6. consider show volumn/count by "To region/Business line"

Data Cleansing

Data Issue

1. Delivery 6104558378
- Spot Ocean Freight USD
 - Total Ocean Freight in USD

DataFormat.Error: We couldn't convert to Number. Details: -

2. Order Number:
- ETA from booking confirmation date, have "BLANK" value.

Data Modeling

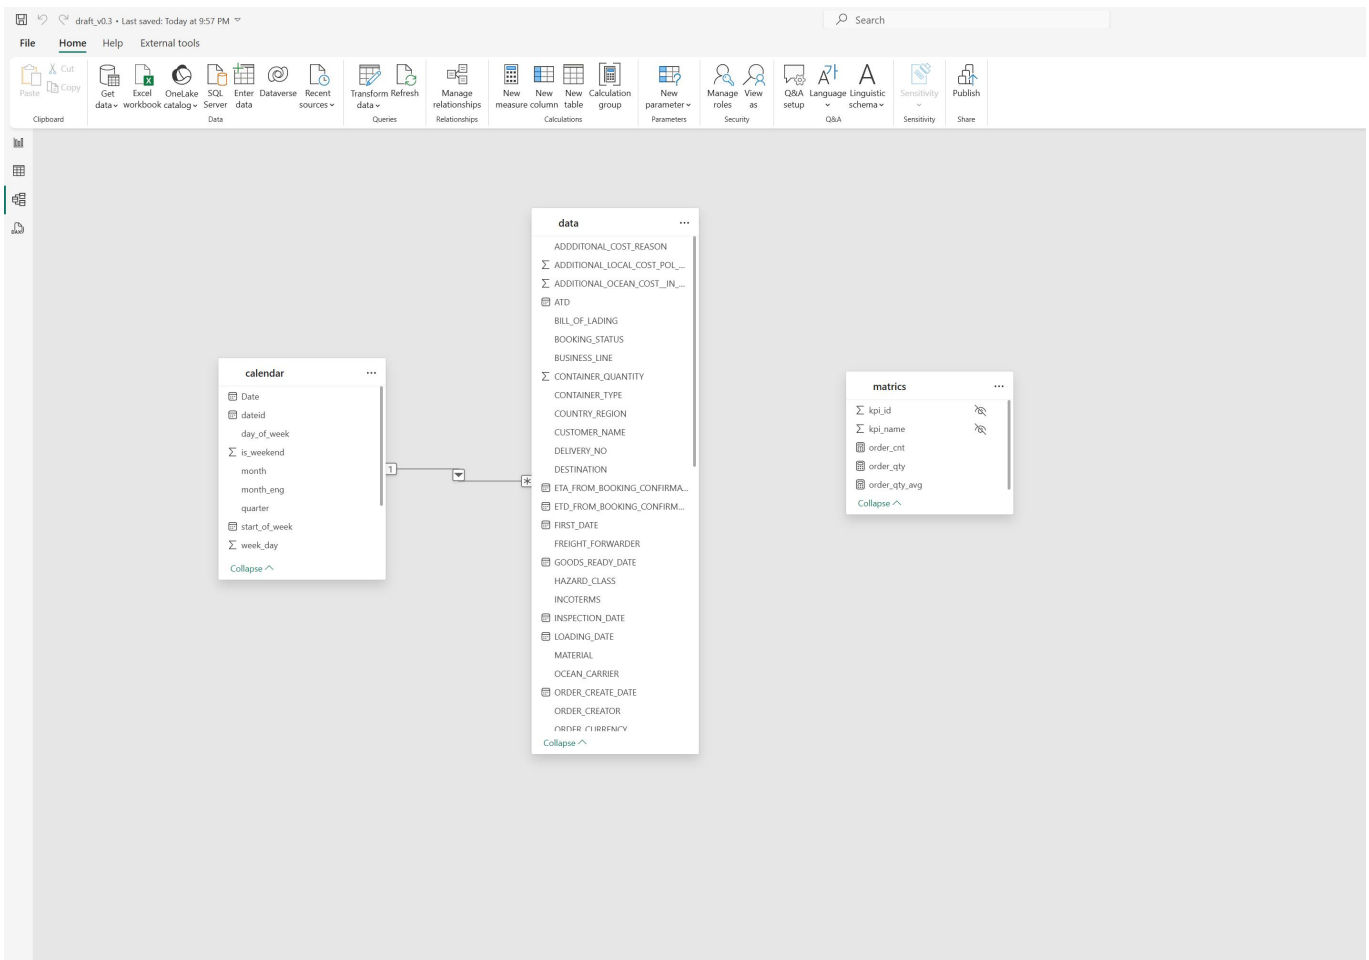

- Calendar Table as date dimension, date scope is from [ORDER_CREATE_DATE]

```
calendar =
var min_dt = MIN('data'[ORDER_CREATE_DATE])
var max_dt = MAX('data'[ORDER_CREATE_DATE])
return ADDCOLUMNS(
    CALENDAR(min_dt, max_dt),
```

```

    "dateid", FORMAT([Date], "yyyy-mm-dd"),
    "year", YEAR([Date]),
    "month", FORMAT([Date], "mm"),
    "year_month", FORMAT([Date], "yyyy-mm"),
    "year_month_abbr", FORMAT([Date], "mmm-yy"),
    "month_eng", FORMAT([Date], "mmmm"),
    "quarter", "Q" & FORMAT([Date], "Q"),
    "day_of_week", FORMAT([Date], "dddd"),
    "week_number", WEEKNUM([Date]),
    "week_day", WEEKDAY([Date]),
    "is_weekend", IF(WEEKDAY([Date], 2) >= 6, 1, 0),
    "start_of_week", [Date] - WEEKDAY([Date], 1) + 1
)

```

DAX

1. A measurement table is created to categorize different measures.

```
metrics = ROW("kpi_id", BLANK(), "kpi_name", BLANK())
```

2. Order Count

```
order_cnt =  
var a = CALCULATE(COUNT(data[ORDER_NO]))  
RETURN IF(ISBLANK(a), 0, a)
```

3. Order Quantity

```
order_qty =  
var a = CALCULATE(SUM(data[order_quantity_new]))  
return IF(ISBLANK(a), 0, a)
```

4. Average Order Quantity

```
order_qty_avg =  
DIVIDE([order_qty], [order_cnt])
```

Visualization

1. Overview
